

4-WAY VALVE

The Automatic connector, or 4-way valve, links SPASCIANI breathing apparatus to compressed air networks.

The 4-way valve is an automatic connector provided with two medium pressure inlets with male quick connector and two medium pressure outlets with female quick connectors. The two inlets can be connected to two different supplies of air in medium pressure while the two outlets can be connected to two operators through demand valves and masks. To the inlets it is possible to connect a compressed air line (inlet name LINE) and a breathing apparatus **RN MK2** or **BVF** (second inlet). The 4-way valve will switch automatically from the line supply to the breathing apparatus one when the air flow from the compressed air line is interrupted by accident or simply due to the disconnection by the operator.

The 4-way valve is available with SPASCIANI quick connectors (standard version) or on request with quick connectors compatible with the ones more commonly used for breathable air compressed lines.

4-way valve

CERTIFICATION

Certificated for the usage with breathing apparatus type 1 and 2 in accordance to EN 137:2006 and with air line respirators in accordance with EN 14593-1:2005.
